

# LEGO Animation Resources

## Space Animation

Produce an animated video about Space, this could be about a satellite visiting a comet and its journey through our solar system, a space battle, a spacecraft visiting a space station, or anything you desire that is in Space.

### Build your characters

What models will appear in your film, will there be any lifeforms or Astronauts? Will you need extra bricks to create special effects?

### Set up your scene

Lay out the Blue Screen to produce a film and set up the I pad where you want it.

Consider where the models will enter and leave your scene and how they will move,

Make sure all of the background is blue and that there are no creases, you can use boxes to form a backdrop if needed.

### Film your Movie with the Lego Movie App

When filming, make sure to move your models a little bit at a time, each photo will only last  $\frac{1}{4}$  of a second, so you need to take at least 40 for a film.

### Save your Video

A space background will be added using the Green Screen App, you can see examples on the Ipad. Choose the background you want from the list below. Open Template A, B, or C in the Green Screen App. Follow the instructions given to import your video and to move your animation into Space.

Finally Write the Name of your movie, the director's name and if you did not have time to add a background tick the background you want on the form provided.
